2. Changed current key to mode+version format to avoid confusion;

3. Added more trigger information. Hover the cursor over the key, click and see the trigger configurations for all subsystems, see the other attachment.

suggestions are only enabled when a run is active

not in run, ignoring logs

(Please call L1 DOC if you do not understand the instructions below.)

If **OMTF** shows the **CSCports error** and/or **EMTF** shows the **numberOfBrokenInputLinks error** on the l1page for more than 60 seconds, then:

- Open the ports tab in the SWATCH cell for the subsystem(s) that is in error.
- If there are more than 4 input ports in error on any OMTF board excluding OMTFn4, or more than 6 input ports in error on any EMTF board excluding EMTF-4, then:

1. Ask the DAQ shifter to issue a hard reset.
2. Ask for another hard reset if the errors do not go away.
3. If after 3-4 hard resets the errors remain call the EMTF and/or OMTF on-call, or the L1 DOC.
